Abstract

Organic electronic component comprising a patterned, semiconducting functional layer and a method for producing said component

electronic to an organic invention relates The component such as an organic field effect transistor said component, and a method for producing semiconducting layer of the component being patterned, produced by be although the component can inexpensive printing method. In order to achieve this, the lower functional layer is prepared by a treatment such that it has partial regions on which wetting takes place in the subsequent process step, and partial regions on which wetting is not effected.
